

Executive Summary: Bahaghari Retail Co.

Performance Analysis & Strategic Insights

Strategic Overview

The Power BI dashboard analysis highlights strong product category concentration, uneven regional performance, and addressable data quality issues. While overall revenue is heavily anchored by the Personal Care segment, significant performance variations exist across geographic regions and individual store locations. Resolving current data anomalies will drastically improve strategic decision-making and accelerate regional growth.

Key Insights & Data Evidence

1. Extreme Category Concentration in Personal Care

- **The Evidence:** The Sales by Category metric reveals that Personal Care accounts for 100% of total sales (~13.61K). Currently, zero revenue contribution is recorded from Beverages, Groceries, or Snacks in the current dataset.
- **Strategic Implication:** This indicates either a severe strategic over-reliance on a single category or an operational failure in data ingestion for other product types. The current revenue model is highly exposed to market fluctuations in Personal Care, and broader retail diversification opportunities remain heavily underutilized.

2. Pronounced Regional Disparity

- **The Evidence:** Sales performance is geographically imbalanced, led heavily by Luzon (~6.2K), followed by Visayas (~3.8K), and Mindanao (~1.8K). Luzon alone drives over 40% of all visible revenue. Additionally, there is an unassigned "Blank" region accounting for ~1.7K in sales.
- **Strategic Implication:** Market penetration and operational efficiency are significantly stronger in Luzon. Targeted localized marketing and supply chain audits are needed to scale performance in the Visayas and Mindanao branches to match Luzon's benchmark.

3. Data Integrity & Mapping Anomaly

- The Evidence: A noticeable portion of sales (~1.7K) is trapped under a (Blank) regional category due to missing or unassigned geographic metadata.
- Strategic Implication: This directly compromises regional reporting accuracy. Management decisions regarding resource allocation, regional budgets, and expansion plans are partially unreliable until store-to-region data tagging is fully remediated.

4. Localized Store-Level Variation

- The Evidence: Treemap data shows that Bahaghari Cebu and Bahaghari Makati are the company's flagship revenue drivers. Conversely, locations like Bahaghari Davao and Bahaghari Caloocan exhibit much lower sales volumes.
- Strategic Implication: Store performance is highly uneven. This disparity points to localized issues such as varying consumer demand, foot traffic constraints, local management execution, or product stockout issues at lower-performing branches.

5. Performance vs. Goal Metric Distortion

- The Evidence: The Goal KPI displays an actual of 595 against a target benchmark of 7 (+8400%).
- Strategic Implication: This massive statistical variance indicates a misconfigured DAX formula, unit scale mismatch (e.g., comparing currency volume against transaction counts), or an unaligned baseline. This KPI logic requires immediate validation before it can be used for corporate performance evaluations.

Recommended Action Plan

1. Data Cleanup & Governance: Audit the stores and transactions tables to assign missing regions, resolve the Category tracking gap, and recalculate the Goal KPI logic.
2. Replicate Flagship Store Playbooks: Analyze the operational, inventory, and marketing strategies utilized at the high-performing Cebu and Makati branches to build a standard operating procedure (SOP) for lower-performing stores.
3. Regional Revenue Diversification: Launch targeted optimization campaigns in Mindanao and Visayas to balance geographic dependencies.
